Introduction

LDCM

- Landsat 8 (L8) Utilized "Test as You Fly, Fly as You Test" Development Approach
- Presentation Will Provide Background on L8 Mission, Development Activities, and Significant New Technologies Flying for First Time
- Step Through Testing Activities and "Test as You Fly" Impacts
- Conclude with Lessons-Learned Pros and Cons of "Test as You Fly" Approach

Data Continuity Mission

LANDSAT

Agenda

- Introduction/Landsat Overview
- Landsat 8 Program and Development Timeline
 - Landsat Data Continuity Mission (LDCM)/Landsat 8 (L8)
 - Comm Architecture and New Technology
 - Test as You Fly, Fly as You Test Approach
- Engineering Model Testing
- RF Compatibility Testing
- Ground Readiness and Mission Readiness Testing
- Satellite Integration and Test
- Launch Readiness Testing
- On-Orbit Verification and Checkout
- Conclusion and Lessons-Learned

Landsat Mission Overview

- Long-Term Operational Moderate-Resolution Land Imaging Program
- Extensive Continuous Historical Record of Observations
- Key Data Source for Global Change Research and Regional Studies
- Large Commercial Applications and User Base
- Large Well-Developed International Cooperator (IC) Network
- Satellites Developed by NASA and Operated by USGS
- LDCM/L8 Recently Launched in February 2013 and Declared Operational at the end of May 2013

Data Continuity Mission

Landsat Mission Overview, cont.

< N5

Landsat 8 Next-Generation Satellite

- Landsat Data Continuity Mission (LDCM) Initiated to Develop Next-Generation Landsat Satellite
 - Operational Land Imager (OLI) is Primary Sensor
 - Thermal Infrared Sensor (TIRS) Added Later
- LDCM Implemented as Landsat 8 (L8) Dedicated Mission/Satellite
 - Satellite Integration Orbital Sciences Corp
 - OLI Ball Aerospace
 - TIRS and Mission Integration NASA/GSFC
 - Ground System USGS

Data Continuity Mission

Landsat 8 Comm Architecture

L A N D S A T

Data Continuity Mission

LDCM

X-Band RF Characteristics

Frequency	8200.5 MHz							
OLI Data Rate (not including 1.55:1 compression)	261 MBits/sec							
TIRS Data Rate (uncompressed)	26 MBits/sec							
Science Data (Mission) Data Rate (prior to LDPC)	384.000 MBits/sec (Includes Fill)							
Forward Error Correction (FEC) Type (achieves 1x10E-12 bit error rate)	7/8 Rate LDPC Reference: CCSDS 131.1-O-2							
Rate to Modulator (includes LDPC overhead)	440.825 MSymbols/sec							
Filtered Bandwidth	374,850 kHz							
Polarization	Left-Hand Circularly Polarized (LHCP)							
Modulation	OQPSK							
Effective Isotropic Radiated Power (EIRP) (peak power density observed in direction of max antenna gain)	20.5 dBWi (Earth-Coverage Antenna)							
Required Eb/No to meet BER of 1x10E-12	14.0 dB							
Demodulator Loss (allowed)	4.3 dB loss							
Nadir Margin (Worst Case)	3.1 dB							
Noise Specification – Minimum G/T at 5 degrees elevation	31 dB/K							
Design Link Availability	97%							

New Landsat 8 Comm Technology

- Required to Support Increased Data Rates and Link Requirements
- CCSDS File Delivery Protocol (CFDP)
 - Allows for Data Management like Files on a PC
 - File Delivery Con Ops of Deletion After Successful Ground Reception
- Next-Generation Solid State Recorder
- Low-Density Parity Check (LDPC) Forward Error Correction (FEC)
 - First Implementation on Flight Program
 - Much More Efficient Than Rate-1/2 Convolutional Coding and Rate-7/8 Reed-Solomon (LDPC is Rate-7/8)
- 10⁻¹² Bit-Error Rate on X-Band Space-to-Ground Link
- Variable Rice Compression for Mission (Image) Data
 - First ASIC Flight Implementation
- Asymmetrical Filtering to Meet DSN and ITU Bandwidth Restrictions
- Improved X-Band TWT Amplifier Implementation and Switch-less Redundant Architecture

• RF Hybrids Used Instead of RF Switches for Improved Reliability

Test as You Fly, Fly as You Test

- Test as You Fly, Fly as You Test Development Approach
 - "Bake In" Compatibility During Development
 - Reduces Surprises on Orbit
- Development Implications
 - Ground System Needs to be Ready (Tested/Certified) Before Flight H/W to Support Testing
 - Reduces Time Available for Ground System Development
 - Need Flexibility in Accommodating Changes in Flight H/W Development
- Test Implications
 - Need to Have Additional Ground System H/W Available to Dedicate to S/C Testing
 - Also Need Ground System Staff to Support S/C Test Activities
 - S/C Development Effort Needs to Accommodate Testing with Ground System, Either Integrated or as Additional Testing

Engineering Model Testing

- Early Test of New Technologies and Demonstration of Ability to Meet BER
 - First Flight Usage for LDPC
 - Provide Time to Address any Performance Shortfalls
- Engineering Model of RF Comm and Data Handling Subsystems Connected to Ops Demod and Down Converter
- Secondary Objective to Demonstrate Data Flow Ops Using Simulated Mission Data
- Conducted in June 2010 in Orbital I&T Lab

DCM

Data Continuity Mission

Engineering Model Test Results

- Demonstrated Compatibility Between Ops Demod and EM Flight H/W
- Demonstrated Required Level of Performance is Achievable
 - Demonstrated Performance at Better Than 10⁻¹³ BER
 - System is Stable and Error-Free Over 10-15 min Period of a Pass
- Identified Some Further Work Needed in CFDP Processing Modules of Demod
 - Also Learned a Few Things About How Test Data Were Constructed that Would be Useful Later...

Data Continuity Mission

RF Compat Testing

- Standard NASA RF Compat Process and Test Procedure
 - NASA Responsible for S-Band (NEN/SN)
 - USGS Responsible for X-Band (LGN -Landsat Ground Network Stations)
- Tailored to Bring Ground Station
 Equipment to S/C Facility for Testing
 - Stations Were Already Operational
 - "Test as You Fly"

<1869

- Some Equipment Also Used for S/C I&T
- Combination of Flight and EM S/C H/W Used for Test, but Representative of Full Flight Configuration
- Testing Done in Combination with Mission Readiness Test to Take Advantage of Equipment Onsite

Data Continuity Mission

LANDSAT

LDCM

Ground Readiness Testing (GRT)

- Verify Ground System Meets Requirements and Ready for Use in S/C Test
- Planned for Completion before S/C Testing Started
 - Needed to Make Changes to Accommodate S/C Design/Implementation
 - Data Processing Testing Deferred to Later in Schedule
- Some Testing Used S/C EM H/W "Test as You Fly"
- Needed to Re-Plan/Re-Phase Testing Schedule as Program Evolved

Mission Readiness Testing (MRT)

- End-to-End Testing with S/C and Ground System
- Ideally was Planned to Reflect Normal Ops Scenarios, But Changed in Order to Exercise All Functionality
 - Every CMD Sent to S/C at Least Once
 - Start with Simple Test Sequences and Work Up to Full Day-/Week-in-the-Life
- MOC Interfaced to S/C Using Ops CMD and TLM Processor (CTP) and RF Interface Rack, or Line-Level Interface from CTP to S/C

Mission Operations Simulations (MOS)

- Focus on Normal Ops Scenarios, Work Through Ops Procedures
- Stress Testing at Normal Ops Level Capacity/Data Flow
- Interleaved with S/C Test Activities
- Test Data Derived from S/C Testing and High-Fidelity S/C Simulator Located at MOC

Satellite Integration and Test

- Orbital Astro-RT TLM and CMD System Used for I&T and Pre-Launch Satellite Testing
 - MOC System Used for MRTs
 - Orbital RF Rack Used for I&T, MRT 2-6, and pre-launch Testing
- "Hallway Ground Station" (HGS) Implemented to Support S/C Testing Activities
 - Initially Planned Just to Have Demod Running in Parallel with S/C Testing to Capture Copy of Test Data for Archival and Anomaly Investigations in Ops
 - Evolved from X-Band Test Rack left at Orbital after RF Compat Testing
 - Added Server Running Subset of Ingest and Data Processing S/W
 - Enhanced Over Course of Testing to Perform Near-Real-Time Data Processing from RF to L1 Product

Data Continuity Mission

Satellite Integration and Test (Cont.)

- Standard Test Suite Developed and Reused at Various Stages of Testing
 - Subsystem-Specific Tests
 - Functional End-to-End Test Cases (CPTs and LPTs)
- Orbital Astro-RT T&C System Used to Control S/C and Run Test Procs
- LabView Scripts Used for Test Equipment Status and Control
- NASA and USGS Test Equipment Connected in Parallel
 - Listen Line to Relay TLM Back to MOC
 - Demod and Capture System for X-Band Data, Some S-Band Equipment Also
 - Mostly Manual Operation

Data Continuity Mission

S/C Environmental Testing

- Electromagnetic Interference (EMI)
 - Functional and Data Flow Tests to Look for Interference
 - S-/X-Band Free-Space Link to S/C
 - Extensive X-Band Data Testing to Assess Potential EMI on Instruments
- Shock/Vibration/Acoustics
 - Instruments Tested, But Not X-Band Data Flows
- Thermal/Vacuum (TV)
 - Same Suite of Functional and Data Flow Tests Run During Ambient I&T Repeated During Thermal Cycling
 - Extended X-Band Operation
 Demonstrated at Hot/Cold Temps
- Onsite Support by MOC and Ground System Development Staff

End-to-End Functional Testing

- Test Procedures Designed with "Test as You Fly" in Mind
 - Demonstrates Operational Scenarios with Instruments Collecting Simulated Data, S/C Processing and Downlinking Data, and Test Equipment Receiving/Processing Data (Like Ops)
 - Also Demonstrates Scheduling of Instrument Operations on S/C in Addition to Real-time Commanding
- Comprehensive Performance Tests (CPT)
 - Executed End-to-End Operational Scenario
 - Multiple Instrument and S/C Modes Tested
 - Derived from Design Reference Case (DRC-16) for Scenario Covering All Functions Used in Operations
 - Ran Multiple Times at Each Stage of S/C Testing
 - Both A- and B-Sides of Instruments and S/C
- Limited Performance Tests (LPT)
 - Abbreviated Subset of CPTs
 - End-to-End Data Flows

Data Continuity Mission

Launch Readiness Testing

- Launch Site Testing
- Tailored Set of Integrated S/C Tests
- Testing After Final Assembly and Integration with Launch Vehicle
- All Satellite Testing Repeated using Orbital RF Test Rack and USGS Hallway Ground Station
- No Testing with MOC

L A N D S A T

Data Continuity Mission

On-Orbit Verification/Commissioning

- On-Orbit Checkout Went Very Smoothly
- Issues Quickly Addressed Some Ground Station Problems in Areas That Weren't Tested Before Launch
 - Development Team Onsite at Gilmore Creek Helped to Quickly Resolve Problems
 - Many Issues Were Expected as Items That Would be Tuned with S/C On-Orbit
 - Some Issues Due to Less-Than-Robust Configuration Management/Control
- Was Able to Quickly Ramp-Up to Beyond Normal Imaging Schedule
 - System Designed for 400 Scenes/Day, Able to Demonstrate Routine Acquisition of 550-600 Scenes/Day

L A N D S A T

Conclusions and Lessons-Learned

- Development
 - Ground System Required to be Ready and Tested While S/C and Instruments Still in Development Incurs Rework Penalty for Updates
 - Assumptions Made in Ground System Design Before S/C and Instruments Detailed Design are Complete
 - Get Early Experience with Equipment, Plenty of Time to Find/Fix Bugs
 - Need to Have Capabilities for Internal Generation of Test Data
 - Ops-Like Equipment Available for S/C and Instrument Test
- Integration and Test
 - Good Understanding of Equipment for Testing Due to Early Access, Streamlines Test Development and Ops (Since Not Learning to Use New Equipment at Same Time)
 - HGS and Ops/Dev Staff Support Invaluable for Quick Resolution of Test Anomalies, Also Provide Additional Resources to Work Issues
 - Ops Staff Gain Detailed Knowledge (Understanding) of S/C and Instrument by Supporting Test
 - Fixes from Testing Easily Transferred to Ops Environment
 - Also Need to Test System for Ops-Like Throughput in Addition to Requirements Verification Testing

Conclusions and Lessons-Learned, cont.

- Mission Readiness/Ops
 - Robust Test Data/Simulation Available from Internal Equipment Testing
 - Can Run Into Issues with Resources Needed for both Mission Testing and Ops Readiness
 - Successes with S/C Testing Can Lead to Complacency and Assumptions that Ops Will Not Have Any Issues
 - Difficult to Provide All Ops Staff with Opportunities to Work Satellite Testing
 - CM Very Important to Maintain "Tested" Configurations Until Launch
- General
 - Need to Invest Early in Equipment, Harder to Take Advantage of Technology Improvements Available Later in Program (i.e. – Faster Computers, Bigger/Cheaper Storage, New/Better Products, etc.)
 - Need to Plan for Technology Advances from Start (i.e. Only Procure First String for Testing, Plan for Later Buys to Size System for Ops...)
 - May Run Into Issues with Equipment Refresh Scheduling (Close to Launch and/or Ops Transition)
 - Can Also Use New Equipment to Support Current Ops Missions in Addition to Development Activities
