SQs Tradespace and Affordability Analysis

Critical nature of system qualities

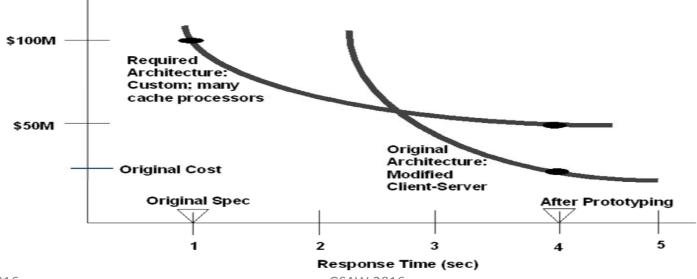

- Or non-functional requirements; ilities
- Major source of project overruns, failures
- Significant source of stakeholder value conflicts
- Poorly defined, understood
- Underemphasized in project management
- Need for ilities ontology
- SQ synergies and conflicts analysis
 - Stakeholder value-based, means-ends hierarchy
 - Synergies and Conflicts matrix and expansion
- Affordability: Next-generation cost estimation models

Importance of SQ Tradeoffs

Major source of DoD system overruns

- System qualities (SQs) have systemwide impact
 - System elements generally just have local impact
- SQs often exhibit asymptotic behavior
 - Watch out for the knee of the curve
- Best architecture is a discontinuous function of SQ level
 - "Build it quickly, tune or fix it later" highly risky
 - Large system example below

Value Conflicts: Security IPT

- Single-agent key distribution; single data copy
 - Reliability: single points of failure
- Elaborate multilayer defense
 - Performance: 50% overhead; real-time deadline problems
- Elaborate authentication
 - Usability: delays, delegation problems; GUI complexity
- Everything at highest level
 - Modifiability: overly complex changes, recertification

Proliferation of Definitions: Resilience

- Wikipedia Resilience variants: Climate, Ecology, Energy Development,
 Engineering and Construction, Network, Organizational, Psychological, Soil
- Ecology and Society Organization Resilience variants: Original-ecological, Extended-ecological, Walker et al. list, Folke et al. list; Systemic-heuristic, Operational, Sociological, Ecological-economic, Social-ecological system, Metaphoric, Sustainabilty-related
- Variants in resilience outcomes
 - Returning to original state; Restoring or improving original state;
 Maintaining same relationships among state variables; Maintaining desired services; Maintaining an acceptable level of service; Retaining essentially the same function, structure, and feedbacks; Absorbing disturbances; Coping with disturbances; Self-organizing; Learning and adaptation; Creating lasting value

Example of Current Practice

- "The system shall have a Mean Time Between Failures of 10,000 hours"
- What is a "failure?"
 - 10,000 hours on liveness
 - But several dropped or garbled messages per hour?
- What is the operational context?
 - Base operations? Field operations? Conflict operations?
- Most management practices focused on functions
 - Requirements, design reviews; traceability matrices; work breakdown structures; data item descriptions; earned value management
- What are the effects on other qualities?
 - Cost, schedule, performance, maintainability?

Need for Qualities Ontology

A structural framework for organizing information about a topic of interest

- Oversimplified one-size-fits all definitions
 - ISO/IEC 25010, Reliability: the degree to which a system, product, or component performs specified functions under specified conditions for a specified period of time
 - OK if specifications are precise, but increasingly "specified conditions" are informal, sunny-day user stories. Satisfying just these will pass ISO/IEC, but fail on rainy-day use cases
 - Need to reflect that different stakeholders rely on different capabilities (functions, performance, flexibility, etc.) at different times and in different environments
- Proliferation of definitions, as with Resilience
- Weak understanding of inter-quality relationships
 - Synergies and Conflicts, as with Security

Initial SERC Qualities Ontology

- Modified version of IDEF5 ontology framework
 - Classes, Subclasses, and Individuals
 - States, Processes, and Relations
- Top classes cover stakeholder value propositions
 - Mission Effectiveness, Life Cycle Efficiency, Dependability, Changeabiity
- Subclasses identify means for achieving higher-class ends
 - Means-ends, one-to-many for top classes
 - Ideally mutually exclusive and exhaustive, but some exceptions
 - Many-to-many for lower-level subclasses
- States, Processes, and Relations cover sources of ility variation
 - States: Internal (beta-test); External (rural, temperate, sunny)
 - Processes: Operational scenarios (normal vs. crisis; experts vs. novices)
 - Relations: Impact of other SQs (security as above, synergies & conflicts)

SQs Tradespace and Affordability Analysis

- Critical nature of system qualities
 - Or non-functional requirements; ilities
 - Major source of project overruns, failures
 - Significant source of stakeholder value conflicts
 - Poorly defined, understood
 - Underemphasized in project management
 - Need for ilities ontology
- SQ synergies and conflicts analysis
 - Stakeholder value-based, means-ends hierarchy
 - Synergies and Conflicts matrix and expansion
 - Affordability: Next-generation cost estimation models

Stakeholder value-based, means-ends hierarchy

- Mission operators and managers want improved Mission Effectiveness
 - Involves Physical Capability, Cyber Capability, Human Usability, Speed, Accuracy,
 Impact, Mobility, Scalability, Versatility, Interoperability
- Mission investors and system owners want Life Cycle Efficiency
 - Involves Cost, Duration, Personnel, Scarce Quantities (capacity, weight, energy, ...);
 Manufacturability, Sustainability
- All want system Dependability: cost-effective defect-freedom, availability, and safety and security for the communities that they serve
 - Involves Reliability, Availability, Maintainability, Survivability, Safety, Security
- In an increasingly dynamic world, all want system Changeability: to be rapidly and cost-effectively changeable
 - Involves Maintainability, Adaptability

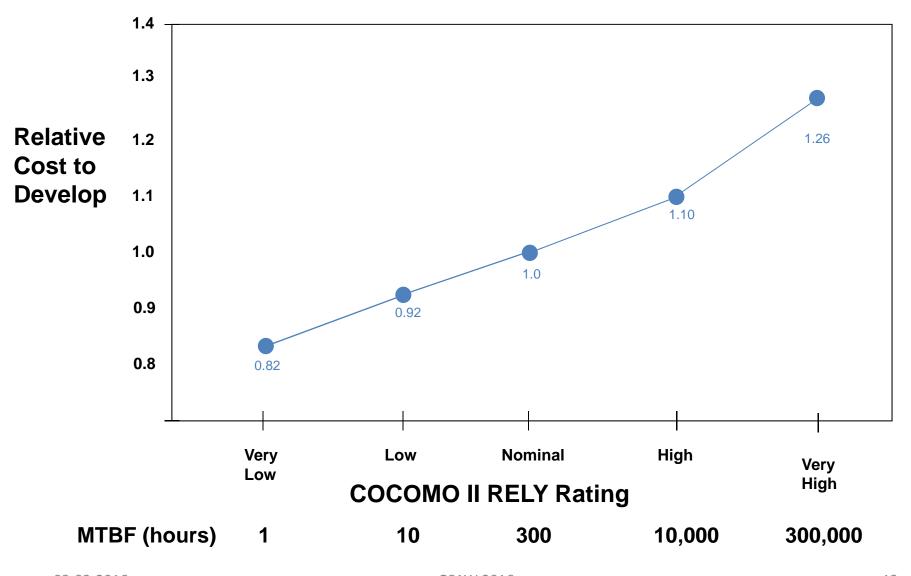

7x7 Synergies and Conflicts Matrix

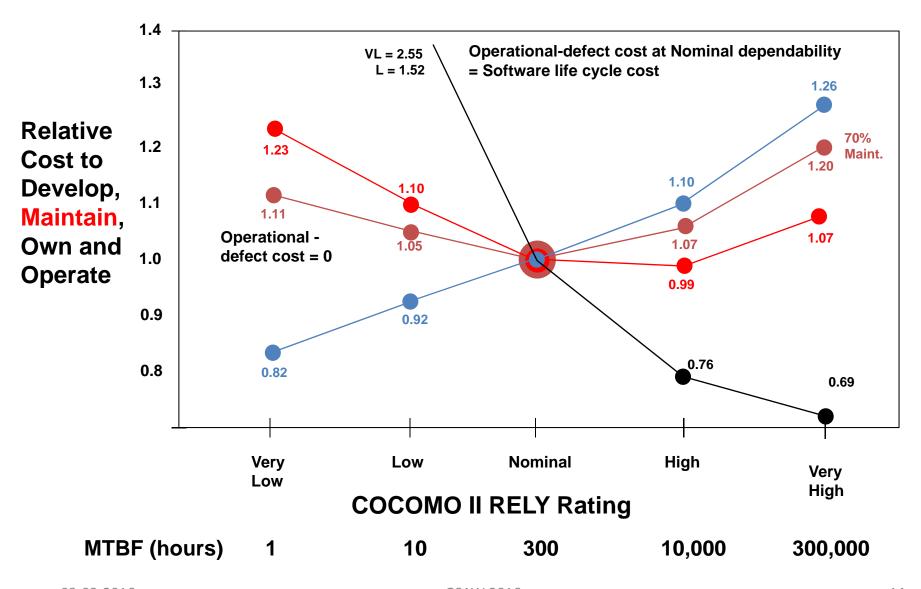

- Mission Effectiveness expanded to 4 elements
 - Physical Capability, Cyber Capability, Interoperability, Other
 Mission Effectiveness (including Usability as Human Capability)
- Synergies and Conflicts among the 7 resulting elements identified in 7x7 matrix
 - Synergies above main diagonal, Conflicts below
- Exploring Qualipedia approach for obtaining details about the synergy or conflict
 - Ideally quantitative; example next
- Still need synergies and conflicts within elements
 - 3x3 Dependability subset developed

Software Development Cost vs. Reliability

Software Ownership Cost vs. Reliability

SQs Tradespace and Affordability Analysis

- Critical nature of system qualities
 - Or non-functional requirements; ilities
 - Major source of project overruns, failures
 - Significant source of stakeholder value conflicts
 - Poorly defined, understood
 - Underemphasized in project management
 - Need for ilities ontology
- SQ synergies and conflicts analysis
 - Stakeholder value-based, means-ends hierarchy
 - Synergies and Conflicts matrix and expansion

Next-generation cost estimation models:

Future challenges and current initiatives

Future Challenges

 Rapid change; Systems of systems; Model-Driven and nondevelopmental item (NDI)-intensive systems; Ultrahigh software system assurance; Legacy maintenance; Brownfield development; Agile and iterative development.

Current Initiatives

- COCOMO III (Brad Clark lead)
 - Preserve most of current COCOMO II parameters
 - Different sizing, cost drivers for different domains
- COSYSMO 3.0 (Jim Alstad lead)
 - Bring together reuse, requirements volatility extensions
 - Address future challenges above

SysML Building Blocks for Cost Modeling

Russell Peak, GTRI; Jo Ann Lane, USC

- Implemented reusable SysML building blocks
 - Based on SoS/COSYSMO SE cost (effort)
 modeling work by Lane, Valerdi, Boehm, et al.
- Successfully applied building blocks to healthcare SoS case study from [Lane 2009]
- Provides key step towards affordability trade studies involving diverse "-ilities" (see MIM slides)

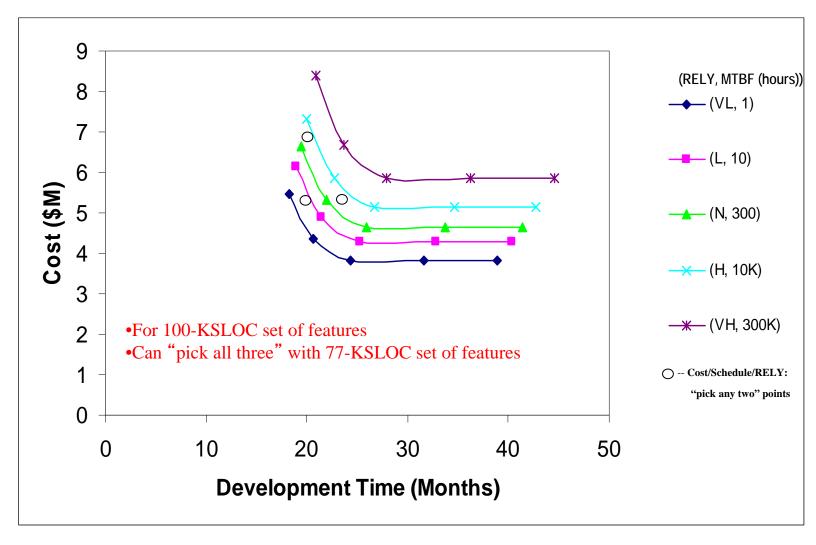

Aspect	Formula	Calculated Effort
SoSE effort (Equation 5)	Effort = 38.55*[((SoS_{CR} / SoS_{Tree})* (SoS_{Tree})* (SoS_{Tree})* $EM_{SOS_{CR}}$) + ((SoS_{RR} / SoS_{Tree})* (SoS_{Tree})* = $38.55*[((SoS_{CR} / SoS_{CR}))]* (SoS_{Tree})* (SoS_{Tree}$	40.41
Pharmacy System effort (Equation 4)	$ \begin{split} & \text{Effort} = 38.55 ^{8} [(1.0 + \text{CS}_{10500})^{*} ((\text{SoS}_{Clatic}/\text{CS}_{Tresplot2})^{8} (\text{CS}_{Tresplot2})^{1068} \text{EM}_{\text{CS-CResplot2}}) + \\ & (\text{CS}_{non50}/\text{CS}_{Tresplot2})^{*} (\text{CS}_{Tresplot2})^{1068} \text{EM}_{\text{CS-CResplot2}})^{1068} \text{EM}_{\text{CS-CResplot2}}) + \\ & = 38.55 ^{8} [(1.15)^{*} ((50.70)^{8} (70)^{106} \text{8} 1.06 + (20.70)^{*} (70)^{1068} 0.72] / 152 \end{split} $	22.02
Laboratory System effort (Equation 4)	$\begin{split} & Effort = 38.55^{*}[(1.0+CS_{00000})^{*}((SOS_{CSB00}CST_{DN00000})^{*}(CST_{DN00000})^{1.06*}EM_{C5-CDN0000}) + \\ & (CS_{models}/CST_{ENg0000})^{*}(CST_{ENg0000})^{1.06*}EM_{C5-CDN00000}) + \\ & = 38.55^{*}((1.15)^{*}(CS)(S)09)^{*}(S0)^{*}(0.16)^{*}(0.16)^{*}(0.16)^{*}(0.16)^{*} = 1.06 + 0)^{1}/52 \end{split}$	19.55
Imaging System effort (Equation 4)	Effort = 38.55 *[(1.0+CS ₃₀₅₀₀)* ((SoS _{C1600} CS _{Treq5052})* (CS _{Treq5052}) ^{1.06} * EM _{C3-CR45052}) + (CS ₃₀₀₅₀₇ (CS _{Treq5052})* (CS ₃₀₀₅₀₇ (CS _{Treq5052}))* (CS ₃₀₀₅₀₇ (CS _{Treq5052}) * (CS ₃₀₀₅₀₇ (0)) * EM _{C50005073} / 152 = 38.55 *[(1.15) * ((50/50)*(50)) * (1.06 + 0)] / 152	19.55
New infrastructure component effort (Equation 1)	Effort = 38.55*EM*(size) ¹⁰⁶ /152 = 38.55*1.0*(100) ^{1.06} /152	33.43
	Total Effort:	134.96

COCOMO II-Based Tradeoff Analysis Better, Cheaper, Faster: Pick Any Two?

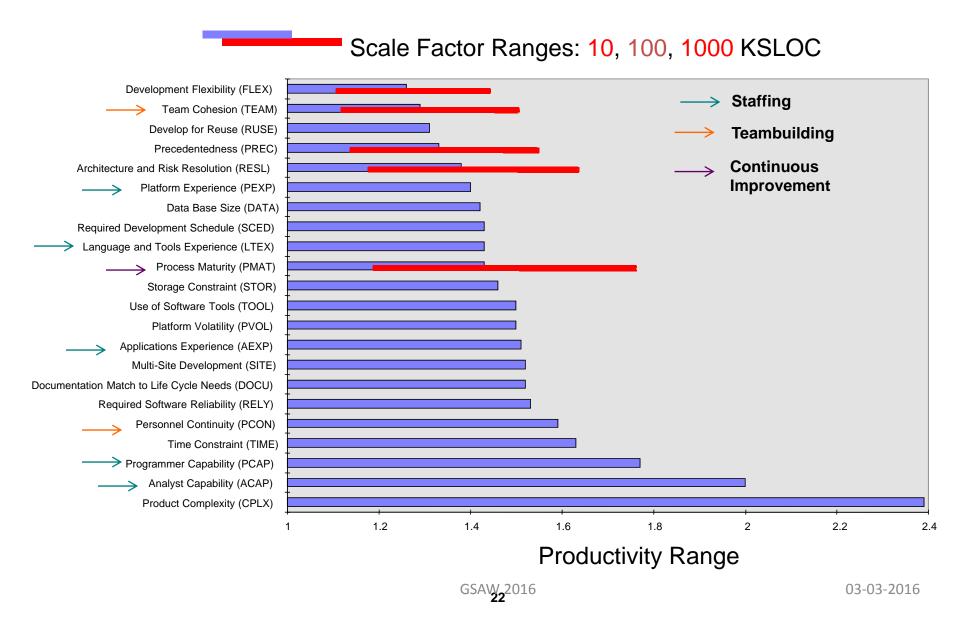

Affordability and Tradespace Framework

	Get the Best from People	Staffing, Incentivizing, Teambuilding Facilities, Support Services Kaizen (continuous improvement)
	Make Tasks More Efficient	Tools and Automation Work and Oversight Streamlining Collaboration Technology
Cost Improvements and Tradeoffs	Eliminate Tasks	Lean and Agile Methods Task Automation Model-Based Product Generation
